Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

patentdocket@oblon.com oblonpat@oblon.com jgardner@oblon.com

	Application No.	Applicant(s)				
Office Action Comments	10/511,608	KANEKO ET AL.				
Office Action Summary	Examiner	Art Unit				
	MCDIEUNEL MARC	3664				
The MAILING DATE of this communication app Period for Reply	ears on the cover sheet with the c	orrespondence address				
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).						
Status

Disposition of Claims						
4) ☐ Claim(s) 1-18 is/are pending in the application. 4a) Of the above claim(s) is/are withdrawn from consideration. 5) ☐ Claim(s) is/are allowed. 6) ☐ Claim(s) 1-18 is/are rejected. 7) ☐ Claim(s) is/are objected to.						
8) Claim(s) are subject to restriction and/or election requirement. Application Papers						
9) ☐ The specification is objected to by the Examiner. 10) ☐ The drawing(s) filed on <u>04 November 2004</u> is/are: a) ☐ accepted or b) ☐ objected to by the Examiner. Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a). Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d). 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.						
Priority under 35 U.S.C. § 119						
 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a) All b) Some * c) None of: 1. Certified copies of the priority documents have been received. 2. Certified copies of the priority documents have been received in Application No. 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). * See the attached detailed Office action for a list of the certified copies not received. 						
Attachment(s) Notice of References Cited (PTO-892)						

Art Unit: 3664

DETAILED ACTION

1. Claims 1-18 are pending.

2. The abstract of the disclosure is objected to because of the word "invention". Correction

is required. See MPEP § 608.01(b).

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

Art Unit: 3664

4. Claims 1-18 are rejected under 35 U.S.C. 102(e) as being anticipated by **Takenaka et al.** (U.S. Pat. No. 6,243,623 B1).

As per claims 1 and 4, <u>Takenaka et al.</u> teaches a system and an associated method legged mobile robot which equals to a walking control for a legged robot, wherein walking control is performed using a foot-sole coordinate system based on sole positions and having at least a first coordinate axis in a direction connecting soles of legs (see figs. 42 and 43, particularly the doted line and the straight line have shown clear evidence of perpendicular axis) and a second coordinate axis perpendicular to the first coordinate axis in a horizontal plane as a control coordinate system for the walking control (see fig. 41 wherein A and A' being taken as horizontal with respect to the feet which in turn perpendicular to the ankle).

As per claim 2, <u>Takenaka et al.</u> teaches a method wherein attitude control is performed with different control characteristics for the first and second coordinate axes of the foot-sole coordinate system in the horizontal plane (see fig. 42, wherein first and second foot require different control).

As per claim 3, <u>Takenaka et al.</u> teaches a method wherein the control characteristics are changed depending on the state of ground-contacting legs (see figs. 10-17) detected by ground contact sensors or a motion generator provided in the legged robot (see fig. 4).

As per claim 5, <u>Takenaka et al.</u> teaches a system that further comprising sole position sensors on the legs, the sole position sensors detecting the sole positions (see fig. 2, element 44),

Page 4

wherein the control device controls leg actuators provided on the legs for walking on the basis of the sole positions detected by the sole position sensors (see fig. 2 and col. 9, lines 36-41).

As per claim 6, <u>Takenaka et al.</u> teaches a system that further comprising ground contact sensors on the legs, the ground contact sensors detecting the contact states of the legs (see fig. 2, element 44), wherein the control device performs the walking control by performing a coordinate transformation to a coordinate system based on the direction connecting the soles of the legs in accordance with the sole positions detected by the sole position sensors and the contact states detected by the ground contact sensors (see fig. 21 and col. 17, lines 3-5).

As per claim 7, **Takenaka et al.** teaches a system that further comprising a motion generator for generating the state of ground-contacting legs (see figs. 1-5), wherein the control device performs the walking control by performing a coordinate transformation to a coordinate system based on the direction connecting the soles of the legs in accordance with the sole positions detected by the sole position sensors and a motion state detected by the motion generator (see fig. 4, particularly the gait generator).

As per claim 8, <u>Takenaka et al.</u> teaches a system wherein the control device inputs control parameters with a coordinate system based on the sole positions detected by the sole position sensors (see fig. 2, element 44 has been considered as position sensor) and sets control characteristics in accordance with the input control parameters (see fig. 1, elements 26 and 60).

As per claims 9 and 13, <u>Takenaka et al.</u> teaches a system wherein the control device changes the control characteristics depending on the state of the ground-contacting legs detected by the ground contact sensors or the motion generator (see figs. 2, 42, 43 and col. 17, lines 3-5).

Art Unit: 3664

As per claim 10, <u>Takenaka et al.</u> teaches a system wherein the control device includes coordinate transforming means for transforming sensor information detected in a coordinate system included in the sensors into the foot-sole coordinate system based on the sole positions of the ground-contacting legs (see fig. 1, element 26 and fig. 4).

As per claim 11, **Takenaka et al.** teaches a system wherein the control device includes coordinate transforming means for transforming motion pattern information described in a coordinate system based on the moving direction into the foot-sole coordinate system based on the direction connecting the soles of the legs (see fig. 4, particularly the gait generator as noted above).

As per claim 12, <u>Takenaka et al.</u> teaches a system that further comprising coordinate transforming means for transforming signals generated in the foot-sole coordinate system based on the direction connecting the soles of the legs into one of the sensor coordinate system included in the sensors (see fig. 2, element 44 as noted bove), the moving-direction coordinate system based on the moving direction of the legged robot, and a body coordinate system based on the body of the legged robot (see fig. 1).

As per claim 14, <u>Takenaka et al.</u> teaches a system wherein the control device includes coordinate transforming means for transforming sensor information detected in a coordinate system included in the sensors into the foot-sole coordinate system based on the sole positions of the ground-contacting legs.

As per claim 15, <u>Takenaka et al.</u> teaches a system wherein the control device includes coordinate transforming means for transforming motion pattern information described in a

Art Unit: 3664

coordinate system based on the moving direction into the foot-sole coordinate system based on the direction connecting the soles of the legs.

As per claims 16-18, <u>Takenaka et al.</u> teaches a system that further comprising coordinate transforming means for transforming signals generated in the foot-sole coordinate system based on the direction connecting the soles of the legs into one of the sensor coordinate system included in the sensor (see fig. 1, element 26 and fig. 4 as noted above), the moving-direction coordinate system based on the moving direction of the legged robot, and a body coordinate system based on the body of the legged robot(see fig. 1).

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to MCDIEUNEL MARC whose telephone number is (571)272-6964. The examiner can normally be reached on 6:30-5:00 Mon-Thu.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Khoi Tran can be reached on (571) 272-6919. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
